## **Introduction**

Neal et al. (1994) classify 12022 as an ilmenite basalt while James and Wright (1972) had termed it an ilmenite-bearing olivine basalt. It has been dated at 3.2 b.y. All surfaces, except perhaps the flat end, were apparently covered with micrometeorite craters (Hörz et al. 1971), making this rock less than ideal for cosmic-ray depth profiles.

## **Petrography**

The petrography of 12022 is discussed in Weill et al. (1971), Brett et al. (1971), McGee et al. (1977). McGee et al. describe 12022 as “a medium grained porphyritic basalt characterized by subhedral olivine (0.3 mm) and pyroxene (1-2 mm) phenocrysts. Several olivine

phenocrysts are epitaxially overgrown with pyroxene. The matrix consists of feathery intergrowths of parallel feldspar tablets (0.05-1 mm), surrounded ilmenite laths (0.03-0.2 mm), anhedral pyroxene crystals (0.6-0.8 mm) and minor glassy mesostasis”.

Ilmenite in 12022 has an interesting cross-cutting, parallel, skeletal habit.

## **Mineralogy**

**Olivine:** Butler (1972) determined the minor element content of olivine in 12022.

*Figure 2: Reflected light photo of thin section 12022, 10 showing alignment of ilmenite, clumps of pyroxene phenocrysts in fine-grained variolitic groundmass. Field of view 1 cm. NASA photo # S70-24742.*

**Pyroxene:** Weill et al. (1971) and Brett et al. (1971) determined that the cores of pyroxene phenocrysts in 12022 are Ca-rich, zoning outward to Fe-rich (figure 4). The zonation of minor elements (Al, Ti, Cr ) in pyroxene in 12022 is discussed in Bence and Papike (1972).

**Plagioclase:** Plagioclase is An<sub>91-85</sub>.

### Mineralogical Mode of 12022

	McGee et al. 1977	Neal et al. 1994	Brett et al. 1971
Olivine	16-33	19.5	16.5
Pyroxene	30-59	56	58.6
Plagioclase	12-26	12.2	12
Opacites	9-23	~9	11.2
“silica”		0.2	
mesostasis	1	2.3	1.6

**Opacites:** Ilmenite laths occur in groups, cutting trough the matrix but not intersecting the phenocrysts (McGee et al. 1977). Subrounded octahedra of Cr-spinel, with or without rims of Ti-spinel, occur in the matrix and as inclusions in olivine and pyroxene phenocrysts.

**Metal:** Brett et al. (1971) determined the Ni content of minute metallic iron grains in 12022 (figure 5).

### Chemistry

Kushiro et al. (1971), Engel et al. (1971) and Snyder et al. (1997) determined relatively high TiO<sub>2</sub> for 12022 (figure 7). Numerous investigators determined trace elements (table 1, figure 6). Kaplan and Petrowski (1971) determined about 20 ppm carbon and 800 ppm

*Figure 3: Photomicrographs of thin section 12022, 9 (plane-polarized, crossed-nicol). Field of view 2.6 mm. NASA phot #s S70-49455-456*

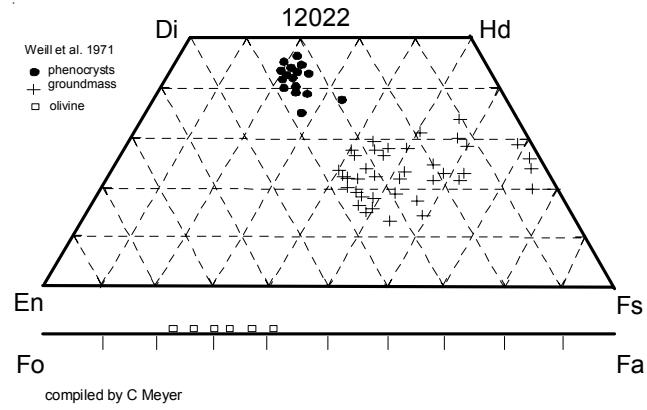

sulfur in 12022. Moore et al. (1971) reported about 40 ppm carbon and 44 ppm nitrogen. Rees and Thode (1972) reported 914 ppm sulfur.

### Radiogenic age dating

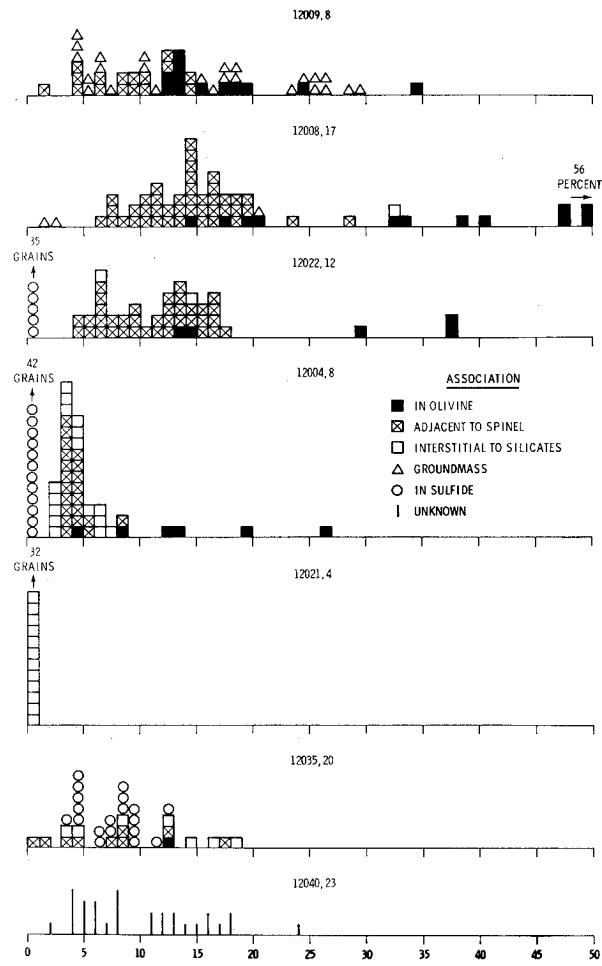

Alexander et al. (1972) determined an age for 12022 of  $3.18 \pm 0.04$  b.y. by the Argon plateau method. Snyder et al. (1997) reported the isotopic composition of Sr and Nd.

### Cosmogenic isotopes and exposure ages

Not reported !

## Other Studies

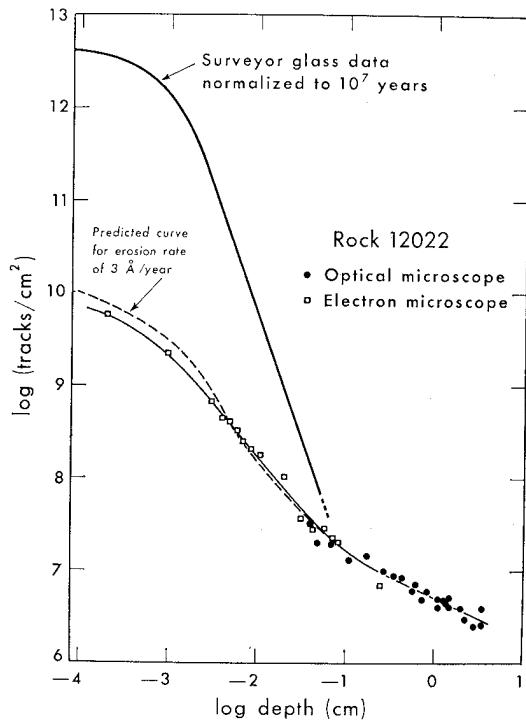

Bogard et al. (1971) reported the content and isotopic composition of rare gases in 12022. Barber et al. (1971) determined the track density and erosion rate (figure 8).

Helsley (1971) found that 12022 has significant magnetic remanence and Chung et al. (1971) determined the dielectric properties.

Gibson and Hubbard (1972) experimentally studied the volatile depletion for 12022.

## Processing

A thick slab (B,14) was cut from the middle of 12022 with a circular saw (figure 9) and a column (,17) was cut from the slab with a wire saw (figure 12). End piece (A,13) was also subdivided with a wire saw (figure 10). A large piece of 12022 is on public display in Wales, England (figure 13).

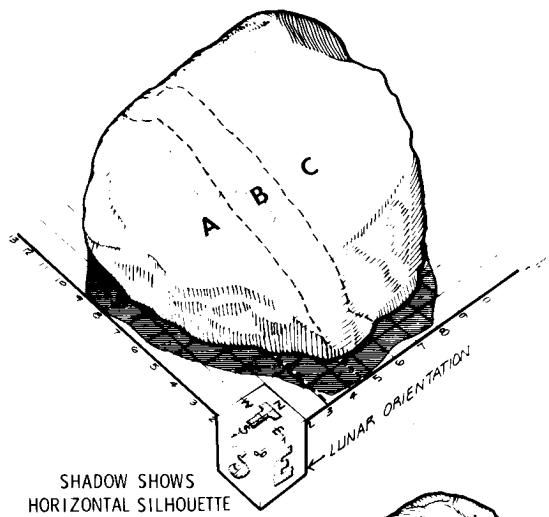

*Figure 8: Track density as function of depth in 12022 (from Barber et al. 1971).*
