

63507
Regolith Breccia
2.8 grams

Figure 1: Photo of 63507. It is about 2 cm across. S81-32697

Introduction

63507 is a friable breccias with a light brown color. It is partially coated with black glass (figure 1).

Petrography

63507 is porous and has a seriate grain size distribution. It has numerous glass spheres and fragments including agglutinates. Lithic clasts include impact melts and granulites (figure 2)

McKay et al. (1986) and Joy et al. (2012) describe 63507 as an ancient regolith breccia, because it has excess ^{40}Ar . It has relatively high $I_s/\text{FeO} = 48$ and very high Ni, Ir and Au content.

Chemistry

McKay et al. (1986) reported the composition, which is like that of the local soil. The rare gas content and isotopic ratios were also determined by McKay et al.
